Help 

Substances may be retrieved by either chemical name or CAS-No.
In all data fields **fragment searching** is enabled and recommended for retrieval.

Example:

Searching for ethyl
will retrieve every substance containing ethyl in its name.

Search entries in different fields (e. g. name and CAS-No.) are linked by a **logical "AND"**.

Klicking the "New search" button or the Return key will initiate the search.
An empty search will retrieve all data sets.

[A](#)[B](#)[C](#)[D](#)[E](#)[F](#)[G](#).....[Z](#)

Klicking on one letter will retrieve an alphabetical listing, only for this letter.
No further fragment searching is possible.
